

Gene expression profiling during gliogenesis in the *Drosophila* embryo

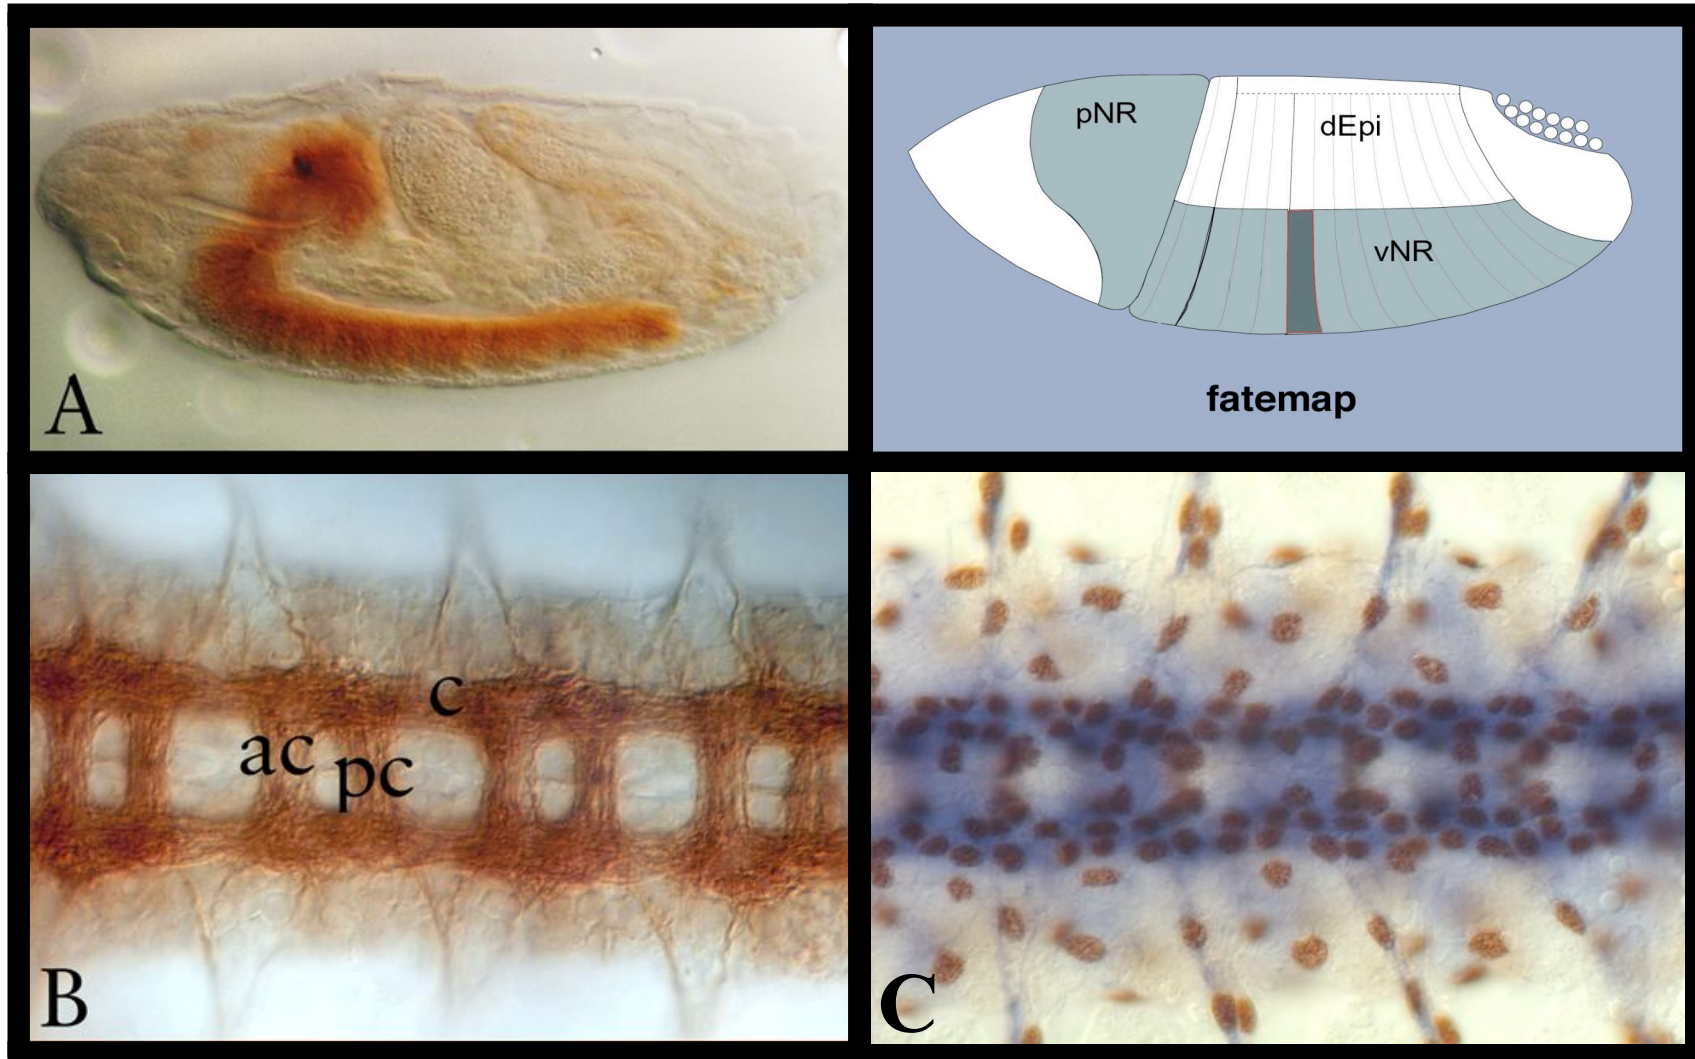

Angela Becker

Introduction to the model organism

Drosophila melanogaster

- **the embryonic development**
- **structure and development of the central nervous system (CNS)**
- **neural stem cells and the regulation of cell fate choice**

The embryonic CNS of *Drosophila*

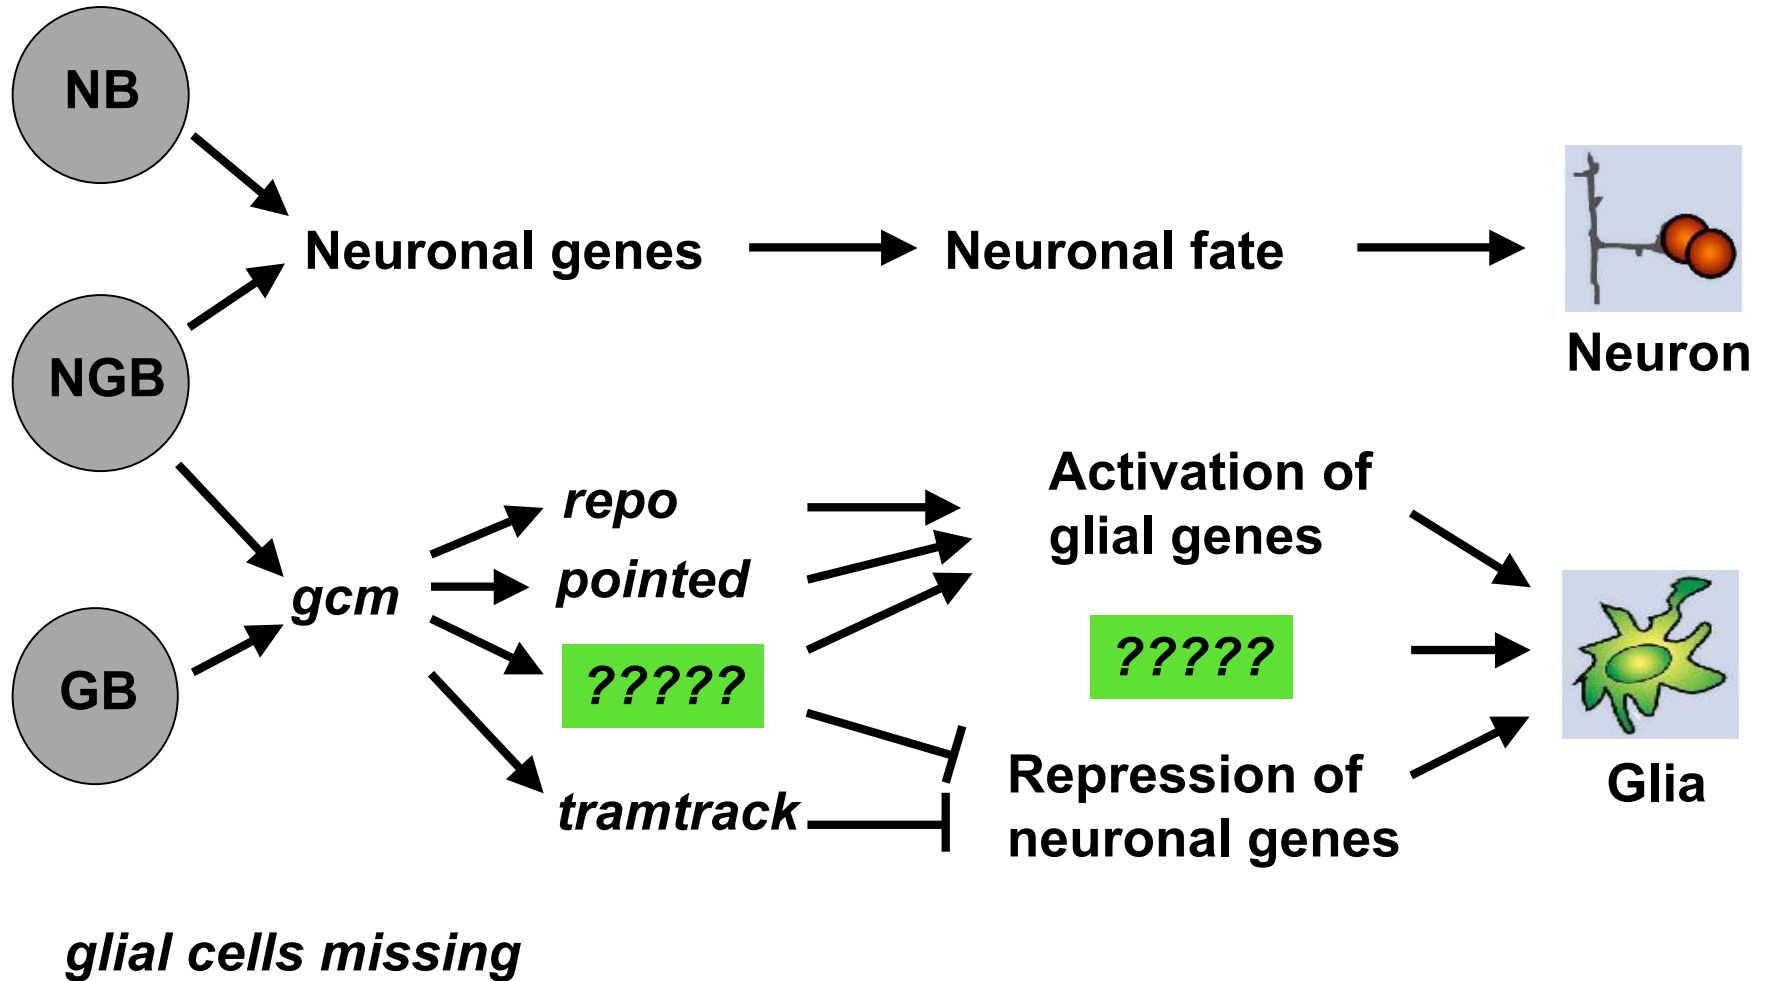

Three types of neural precursor cells in the CNS

Neuroblast

Regulation of cell fate choice

Design and performance of a dual microarray approach

Aim: Identification of *gcm*-dependent target genes

- **Genome-wide search based on microarray-experiments**

Microarray Experiments

„wildtype situation“

Cy3

labelled cDNA

Preparation of
total RNA
(targets)

Reverse
transcription of
mRNA

Labelling with
fluorescent dyes

„mutant situation“

Cy5

labelled cDNA

„wildtype situation“

„mutant situation“

**Hybridization on
microarrays**

Scanning the slide

-  expressed in wildtype
-  expressed in both
-  expressed in both
-  expressed in mutant

“FlyArray, Heidelberg”

Genome annotation, gene prediction, primer calculation, PCR, and spotting were done by the FlyArray consortium Heidelberg (Groups of J. Hoheisel, R. Paro, F. Sauer)

High density array with 47.616 spots:
21.306 double spotted ORFs plus 2502 controls,

Aim: Identification of *gcm*-dependent target genes

- **Genome-wide search based on microarray-experiments**
- **two approaches :**
 - **ectopic expression of *gcm* with the UAS/Gal4 System (gain-of-function/GOF)**

The UAS/GAL4 System

Brandt and Perrimon, 1993

Ectopic expression of *gcm* transforms potential neurons into glial cells

Stadium 16

wt

Mz1060:gcm

Repo/BP102
← anterior

Aim: Identification of *gcm*-dependent target genes

- **Genome-wide search based on microarray-experiments**
- **two approaches :**
 - **ectopic expression of *gcm* with the UAS/Gal4 System (gain-of-function/GOF)**
 - **loss-of-function of *gcm*(LOF)**

Gcm loss-of-function embryos lack nearly all glial cells

Stadium 16

wt

gcm⁻

Repo/BP102

Microarray time course approach

wt

Checklist for quality controls and replicates before microarray evaluation

- **Check developmental and genetic background (Antibody-staining) before RNA-Isolation**
- **Check degradation of Total-RNA (RNA-Gel)**
- **include dye-swaps (Cy3/Cy5)**
- **at least 4 replicates for each stage (double-spotted arrays)**

Evaluation and result of the microarray approach

Quality control and determination of the methodical and genetic background

- **determination of significantly differentially regulated genes**
- **equitation of non-equal genetic backgrounds by a „pooled“ wildtype control (GOF only)**

→ reliable and more sensitive evaluation of data

Use of microarray-software

- **Genepix as „spotfinder“: extraction of raw data**
- **MChips-Software:**
 - **background subtraction**
 - **normalization**
 - **determination of correlation coefficient: comparison of replicates on the array**

filtering by intensity: at least one value above threshold

filtering by ratio 1.5: at least one value above threshold

filtering by reproducibility

correspondance analysis (CA)

CA-Plot

graphical illustration to see comparability of your replicated arrays and the difference between your data (wt:mutant)

Problem: Still too many candidate genes

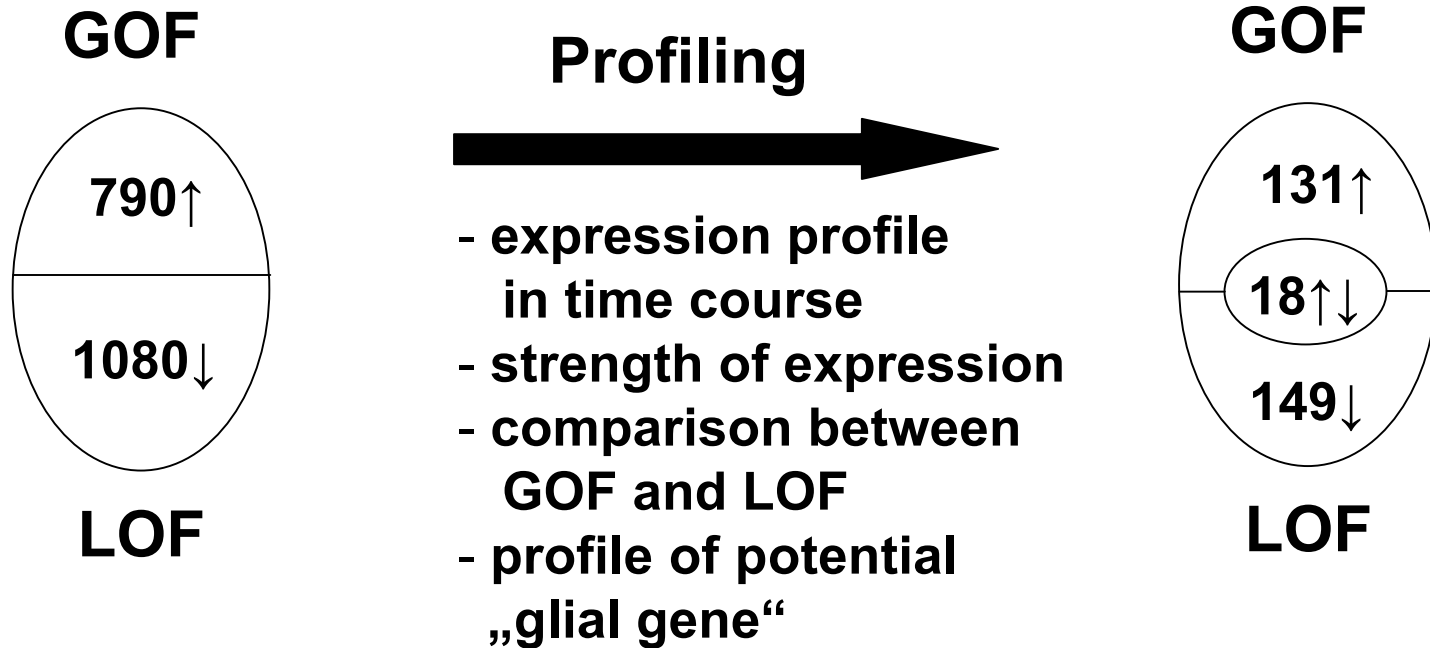

GOF	St. 9	St. 10	St. 11	St. 12	St. 13	St. 14	St. 15	St. 16	Total No.
No. of diff. reg. genes (total)	877	743	425	395	388	107	107	111	1413
Upregulated genes (>1.5)	399	496	328	372	322	98	106	89	789
Downregulated genes (<-1.5)	478	247	97	23	66	9	1	22	625

LOF	St. 9	St. 10	St. 11	St. 12	St. 13	St. 14	St. 15	St. 16	Total No.
No. of diff. reg. genes (total)		598	575	627	632	245		560	2086
Upregulated genes (>1.5)		353	193	180	269	161		386	1056
Downregulated genes (<-1.5)		245	382	447	363	84		174	1080

The advantage of time course experiments: Profiling

differentially regulated genes above ratio 1.5

298 potential candidate genes
